

LifeGuide – Randomised Control Trial Experiment Information Sheet

You are about to participate in a short experiment in which you will be asked to set up several randomised control trials, specifying how the participants in the trial will be assigned to the different intervention groups. You will need to write a short specification for each trial, in a format which will be understood by the system we are developing.

You will be provided with:

- A guidance sheet, which describes how to specify the various parameters of the trial, with examples.
- A task sheet, which contains descriptions of several hypothetical trials. For each of these, you will be asked to write the specification which would set up the system to run that trial.
